# Third Libaray

2016年5月21日 星期六 下午1:10

#### 常用框架集合

Xcode插件

## github、CocoaPods

2016年5月16日 星期一 下午2:41

git init 初始化本地仓库
git add . 将文件放入缓存区
git commit -m "提交注释内如"
git push origin master 推送到主分支
git clone 网址
git pull 将远程仓库的最新版本下拉到本地

#### CocoaPods

1、安装

\$ sudo gem install cocoapods

\$ pod setup

### 2、更改repo源

gem sources --remove <a href="https://rubygems.org/">https://rubygems.org/</a> gem sources -a <a href="https://ruby.taobao.org/">https://ruby.taobao.org/</a> gem sources -l

pod repo remove master pod repo add master <a href="https://gitcafe.com/akuandev/Specs.git">https://github.com/CocoaPods/Specs.git</a> pod repo update

pod init 自动创建Podfile pod install

pod update ->Podfile.lock

pod search

### 4、使用私有pods

pod 'MyCommon', :podspec => 'https://yuantiku.com/common/myCommon.podspec'

#### 原理:

所有的依赖库都放到一个名为Pods项目中,然后让主项目依赖Pods项目,Pods最终会编译成-名为libPods.a文件,主项目只需依赖这个.a文件即可。CocoaPods提供一个Pods-resources.s本,项目编译时会执行,将三方库资源复制到目标目录。Pods.xcconfig设置依赖和参数。

### 5、常见错误,卸载重装

sudo rm -fr ~/.cocoapods/repos/master
sudo gem uninstall cocoapods
sudo gem update
sudo gem instal cocoapods
pod setup

Cocoa Pods

### **Masonry**

pod 'Masonry'

一个 sh脚

```
mas_makeConstraints
mas_updateConstraints
mas_remakeConstraints

UIEdgeInsets padding = UIEdgeInsetsMake(10, 10, 10, 10);

[view1 mas_makeConstraints:^(MASConstraintMaker *make) {
    make.top.equalTo(superview.mas_top).with.offset(padding.top);
    make.right.equalTo(superview.mas_right).with.offset(-padding.right);
    .....
}];

[view1 mas_makeConstraints:^(MASConstraintMaker *make) {
    make.edges.equalTo(superview).with.insets(padding);
}];

make.center.equalTo(ws.view);//将sv居中
make.size.mas_equalTo(CGSizeMake(300, 300));//将size设置成(300,300)

equalTo 和 mas_equalTo的区别
mas_equalTo是一个MACRO,是equalTo的封装,CGSize NSNumber UIEdgeinsets
```

equalTo适用于基本数据类型,而mas\_equaalTo适用于类似UIEdgeInsetsMake 等复杂类型

### **MJRefresh**

用法简单的下拉刷新框架

本上它可以替换equalTo

- 1、支持的控件: UIScrollView、UITableView、UICollectionView、UIWebView
- 2 pod 'MJRefresh'
- 3、类结构图

**MJRefreshFooter** 基础的上拉刷新控件

MJRefreshAutoFooter

MJRefreshAutoStateFooter

会自动刷新的上拉刷新控件 带有状态文字的上拉刷新控件

#### 下拉刷新

默认(Normal): MJRefreshNormalHeader

动图 (Gif): MJRefreshGifHeader

#### 上拉刷新

自动刷新(Auto): MJRefreshAutoNormalFooter、MJRefreshAutoGifFooter

自动回弹(Back): MJRefreshBackNormalFooter、MJRefreshBackGifFooter

- (void)beginRefreshing;/\*\* 进入刷新状态 \*/
- (void)endRefreshing;/\*\* 结束刷新状态 \*/
- (BOOL)isRefreshing;/\*\* 是否正在刷新 \*/

BOOL automaticallyChangeAlpha;/\*\* 根据拖拽比例自动切换透明度 \*/

### 创建实例

footer/headerWithRefreshingBlock: footer/headerWithRefreshingTarget: refreshingAction:

- (void)endRefreshingWithNoMoreData; /\*\* 提示没有更多的数据 \*/
- (void)resetNoMoreData; /\*\* 重置没有更多的数据(消除没有更多数据的状态) \*/

### 属性

lastUpdatedTime /\*\* 上一次下拉刷新成功的时间 \*/

ignoredScrollViewContentInsetTop /\*\* 忽略多少scrollView的contentInset的top automaticallyHidden /\*\* 自动根据有无数据来显示和隐藏(有数据显示,无数据隐藏) automaticallyRefresh /\*\* 是否自动刷新(默认为YES) \*/

/\*\* 当底部控件出现多少时就自动刷新(默认为1.0,即底部控件完全出现时会自动刷新)\* triggerAutomaticallyRefreshPercent

MJHetresnBackGitFooter 带动图的上拉刷新控件

MJRefreshAutoNormalFooter

默认的上拉刷新控件

MJRefreshAutoGifFooter

带动图的上拉刷新控件

#### 设置动画图片

// 自定义轮播时间间隔

```
// 设置正在刷新状态的动画图片,状态(MJRefreshStateIdle,MJRefreshStatePulling)
[header setImages:refreshingImages forState:MJRefreshStateRefreshing];
// 隐藏时间 可以自定义label
header.lastUpdatedTimeLabel.hidden = YES;
// 隐藏状态
header.stateLabel.hidden = YES;
SDCycleScrollView
图片轮播原理
pod 'SDCycleScrollView','~> 1.64'
// 网络加载图片的轮播器
SDCycleScrollView *cycleScrollView = [cycleScrollViewWithFrame:frame
delegate:delegate placeholderImage:placeholderImage];
cycleScrollView.imageURLStringsGroup = imagesURLStrings;
// 本地加载图片的轮播器
SDCycleScrollView *cycleScrollView = [SDCycleScrollView cycleScrollVieww
imagesGroup:图片数组];
// 在iOS 7以后, controller 会对其中唯一的scrollView或其子类调整内边距
self.automaticallyAdjustsScrollViewInsets = NO
// 设置pageControl居右,默认居中
cycleScrollView.pageControlAliment = SDCycleScrollViewPageContolAlimentRight;
// 如果设置title数组,则会在图片下面添加标题
cycleScrollView.titlesGroup = 标题数组(数组元素个数必须和图片数组元素个数保持一致)
// 如需监听图片点击,请设置代理,实现代理方法
cycleScrollView.delegate = ;
```

ithFrame:

### **IQKeyboardManager**

```
自动键盘回收,配置IQKeyboardManager单利可放在AppDelegate或第一次使用时 IQKeyboardManager *manager = [IQKeyboardManager sharedManager]; manager.enable = YES; manager.shouldResignOnTouchOutside = YES; manager.shouldToolbarUsesTextFieldTintColor = YES; manager.enableAutoToolbar = YES; manager.enableAutoToolbar = YES; manager.toolbarManageBehaviour = IQAutoToolbarByTag; 设置最后一个输入框的ReturnKey关键字 IQKeyboardReturnKeyHandler *retuenKeyHandler = [[IQKeyboardReturnKeyHandleralloc] initWithViewController:self]; retuenKeyHandler.lastTextFieldReturnKeyType = UIReturnKeyDone;
```

## 百度地图SDK

申请秘钥key

Key: S2x0Ge2tYnSrekFkolKc5SGY

cn.tarena.test

百度地图集成

POI (Point Of Interest)搜索关键词

流程:给定城市名字和关键词,发送请求,返回结果,在地图上添加大头针

### **MJExtension**

A fast, convenient and nonintrusive conversion between JSON and model.

```
1、JSON/JSONString -> Model (兼容模型中包含模型)
[User objectWithKeyValues:dict]
[User objectWithKeyValues:jsonString]
2、模型中有数组属性,数组里又有模型
[StatusResult setupObjectClassInArray:^NSDictionary *{
   return @{
              @"statuses" : @"Status",
              // @"statuses" : [Status class],
              @"ads" : @"Ad"
              // @"ads" : [Ad class]
          };
}];
3、模型中的属性名和字典中的key不相同(需要多级映射)
[Student setupReplacedKeyFromPropertyName:^NSDictionary *{
   return @{
              @"ID": @"id",//@"属性名":@"字典key"
              @"oldName" : @"name.oldName",
          };
}];
4、将字典数组转换为模型数组
[User objectArrayWithKeyValuesArray:dictArray]
5、模型转字典,模型数组转字典数组
NSDictionary *stuDict = stu.keyValues;
[User keyValuesArrayWithObjectArray:userArray]
6. Core Data
NSManagedObjectContext *context = nil;
User *user = [User objectWithKeyValues:dict context:context];
[context save:nil];
7. Coding
// what properties not to be coded 忽略不序列化的属性
[User mj setupIgnoredCodingPropertyNames:^NSArray *{
   return @[@"name"];
}];
[NSKeyedArchiver archiveRootObject:user toFile:file];
[NSKeyedUnarchiver unarchiveObjectWithFile:file];
```

#### 重写该方法

- (id)mj\_newValueFromOldValue:(id)oldValue property:(MJProperty\*)propert

### FDFullscreenPopGesture(全屏返回手势)

An UINavigationController's category to enable fullscreen pop gesture in an iOS7+ sys with AOP.

```
pod 'FDFullscreenPopGesture', '~> 1.1'
UINavigationController 管理了串行的 N 个 UIViewController 栈式的 push 和 pop
iOS7 之后为 vc 控制自己的 status bar , UINavigationBar依然是全局的
preferredStatusBarStyle
prefersStatusBarHidden
preferredStatusBarUpdateAnimation
```

```
导入工程即可,不用写一行代码
- (void)viewDidLoad
[super viewDidLoad];
self.navigationController.fd_prefersNavigationBarHidden = YES;
}
```

## **MBProgressHUD**

```
pod 'MBProgressHUD', '~> 0.9.2'
hud.removeFromSuperViewOnHide = YES; //隐藏时候从父控件中移除
hud.dimBackground = YES; //YES代表需要蒙版效果

用法1:

MBProgressHUD *hud = [MBProgressHUD showHUDAddedTo:self.view animated:YES];
hud.mode = MBProgressHUDModeText;
hud.labelText.text = @"网络繁忙,请稍后再试";
hud.margin = 10;
[hud hideAnimated:YES afterDelay:3];
[hud removeFromSuperViewOnHide];

田法2:
```

tem style

```
self.hud = [MBProgressHUD showHUDAddedTo:self.view animated:YES];
[self.hud hideAnimated:YES];

MBProgressHUD *hud = [MBProgressHUD showHUDAddedTo:self.view animated:YES]
hud.mode = MBProgressHUDModeAnnularDeterminate;
hud.labelText = @"Loading";
[self doSomethingInBackgroundWithProgressCallback:^(float progress) {
    hud.progress = progress;
    // 从self.view中获取HUDView,如果没有声明变量可以用下面的方式更新进度
    [MBProgressHUD HUDForView:self.view].progress=progress;
} completionCallback:^{
    [hud hide:YES];
}];
```

## **AFNetworking**

pod 'AFNetworking', '~> 3.0'

AFNetworkReachabilityManager

- AFURLSessionManager

  - 2. Upload Task
     uploadTaskWithRequest
  - 3. Upload Task for a Multi-Part Request, with Progress

[AFHTTPRequestSerializer serializer] multipartFormRequestWithMethoduploadTaskWithStreamedRequest

4、Data Task

[manager dataTaskWithRequest

AFHTTPSessionManager

is a subclass of `AFURLSessionManager` with convenience methods for making HTTP request. POST  $\ensuremath{\mathsf{T}}$ 

### CocoaLumberjack (替换NSLog -> log4j )

];

d:@"POST"

uests

**YYKit** ( YYKit is a collection of iOS components ) pod 'YYKit'

- YYModel <u>YYCache</u> <u>YYImage</u> <u>YYWebImage</u> <u>YYText</u> <u>YYKeyboardManager</u>
- YYDispatchQueuePool 、 YYAsyncLayer 、 YYCategories

## **JTSImageViewController**

An interactive iOS image viewer that does it all: double tap to zoom, flick to dismiss, 图像点击查看大图

## **HMSegmentedControl** SVSegmentedControl

标签滚动

## ARSegmentPager, TwitterCover

tableView下拉、上拉, header图片放大或缩小

### **NJKWebViewProgress**

通过计算需要加载的请求的个数来现实加载进度

webViewDidStartLoad -> webViewDidFinishLoad/didFailLoadWithError

动态控制资源请求数量 finished->+1,error->-1

progress = loadingCount / maxLoadCount
